**DESCRIPTION**

The MC34063AG series is a monolithic control circuit delivering the main functions for DC-DC voltage converting. The device contains an internal temperature compensated reference, comparator, duty cycle controlled oscillator with an active current limit circuit driver and high current output switch.

Output voltage is adjustable through two external resistors with a 2% reference accuracy.

Employing a minimum number of external components the MC34063AG devices series is designed for Step-Down, Step-Up and Voltage-Inverting applications.

Note 1. Maximum package power dissipation limit must be observed.

Note 2.  $T_{LOW}= -40^\circ C$ ,  $T_{HIGH}= +125^\circ C$

Note 3. If Darlington configuration is not used, care must be taken to avoid deep saturation of output switch.

The resulting switch-off time may be adversely affected.

In a Darlington configuration the following output driver condition is suggested:

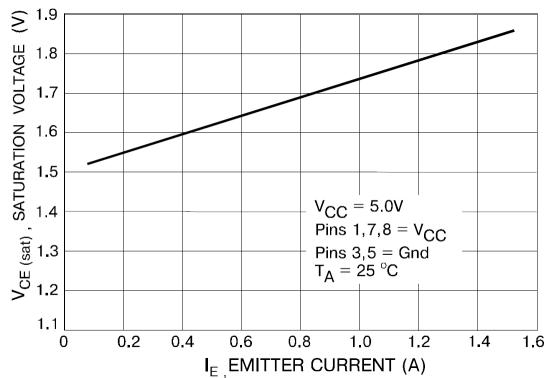

$$\text{Forced } \beta \text{ of output switch : } \frac{I_{C(OUTPUT)}}{I_{C(DRIVER)} - 7.0mA^*} \geq 10$$

\* Currentless due to a built in  $1K\Omega$  anti-leakage resistor
