光电开关工作原理 Photoelectric switch Principle of photoelectric switch

光电开关的原理是根据投光器发射的光束，被物体阻断或部分反射，受光器最终据此做出判断反应。

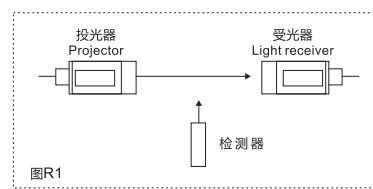

The working principle of the photoelectric switch is that when the beam emitted by the emitter is blocked or partly reflected by the object, the beam receiver whereby makes a judgment and reacts.

类型说明 Description Thru-beam type

对射式(透射型) Diact type (through type) 对射式光电开关是将投光器与受光器置于相对的两个装置，光束也是在相对的两个装置之间，穿达投光器与受光器之间的物体阻断光束并启动受光器。(图R1)

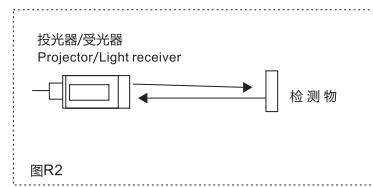

Through-beam type photoelectric switch is designed that via the light beam between opposite-mounted transmitter and receiver, the object passing through these two devices will interrupt the light beam and start the receiver.(Fig.R1)

扩散反射型(漫反射型) Diffuse type

扩散反射型光电开关将投光器与受光器置于一体内，光电开关反射的光被检测物体反射回受光器。(图R2)

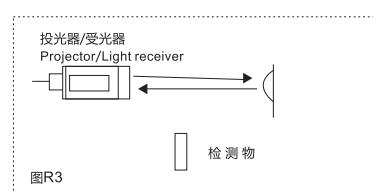

Diffuse reflection type photoelectric switch integrates the transmitter and the receiver. Light reflected by the photoelectric switch is reflected back to the receiver by the detected object.(Fig.R2)

镜面反射型(反馈反射型) Retroreflective type

镜面反射型的反射式光电开关也将投光器与受光器置于一体内，它不同于其它模式是它采用反射板将光线反射型光电开关，光电开关反反射板之间的物体虽然也反反射光线，但其效率远低于反射板，因而切断反射光束。(图R3)

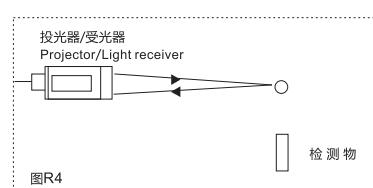

Retroreflective type photoelectric switch also integrates the transmitter and the receiver. Its difference from other models is that reflector is used to reflect light to the photoelectric switch. Though the object between the photoelectric switch and reflector can reflect the light, it is much less efficient than the reflector so as to cut down reflected light.(Fig.R3)

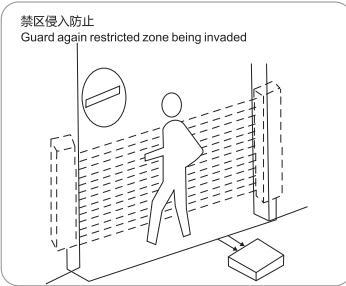

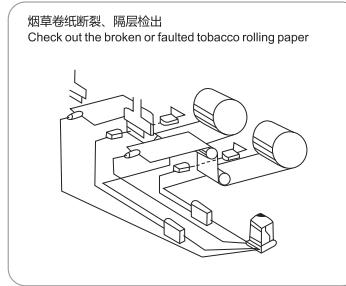

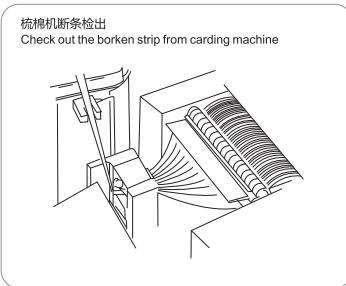

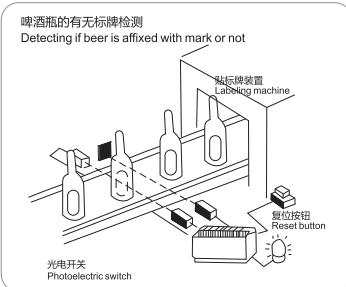

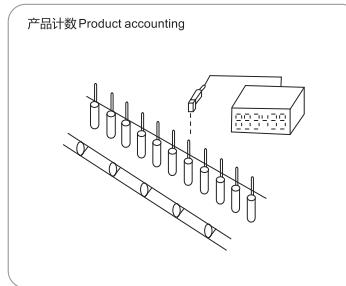

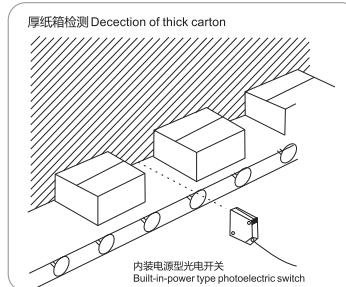

会聚型反射型(聚光型) Convergence reflection type (condensation type)

会聚型反射式的光电开关的工作原理类似于直接反射式光电开关，然而其投光器与受光器聚焦于物距离，只有当物体出现在聚焦时，光电开关才有动作。(图R4)

The working principle of convergence reflection type photoswitch is similar to that of direct reflection type one, while its projector and light receiver focus on object distance, only when the object presents to the focus can the photoswitch actuate.(Fig.R4)

产品简介 Introduction

SN-GDD-1型对射/漫反射红外线开关由一对红外线发射器和接收器相对安装构成电路。产品接通电源后，当来自发射器的红外线光束被物体阻断时，接收器就输出一个电信号(NPN/PNP)给需要控制的设备及系统。

SN-GDD-1 beam/diffused infrared photoelectric sensor consist of a pair of emitter and receiver installed face to face which compose a circuit. After power is supplied, the receiver will send out an electric signal (NPN/PNP) to the controlled equipment and system when the infrared beam from emitter is blocked by an object.
