### 电容式接近开关 Capacitance proximity switch

- ◆ 电容式传感器的感应面由两个同轴金属电极构成，很象“打开”的电容电极，该两个电极构成一个电容，串接在RC震荡回路中。
- ◆ 电源接通时，RC振荡器不振荡，当一个目标朝着电容器的电极靠近时，电容器的容量增加，使振荡器开始振荡。通过后级电路的处理，将停振和振荡两种信号转换成开关信号，从而起到了检测有无物体存在的目的。该传感器能检测金属物体，也能检测非金属物体，对金属物体可以获得最大的动作距离，对非金属物体动作距离决定于材料的介电常数ε，材料的介电常数越大，可获得的动作距离越大。
- ◆ The induction surface of capacitance sensor is composed of two coaxial metal electrodes, which form a capacitor and connected on RC oscillation circuit, just like an open capacitor electrode.
- ◆ When connecting to power supply, RC oscillator does not work. When an object is close to capacitor electrode, the capacitor capacity will increase, and the oscillator will vibrate. Through the treatment of behind stage circuit, both signals of stop oscillation and oscillation will be converted to switch signs for checking the existence of object. this distance can be obtained, but to nonmetal object, the action distance is determined by material dielectric constant, the more dielectric constant, the more action distance will be obtained.

当一个目标靠近时，电容式接近开关的电流消耗随之增加。  
When an object approaches, the current consumption of capacitance proximity switch will increase proportionally.
