

# High-Current Complementary Silicon Transistors

... for use as output devices in complementary general purpose amplifier applications.

- High DC Current Gain —  $h_{FE} = 1000$  (Min) @  $I_C = 20$  Adc
- Monolithic Construction with Built-in Base Emitter Shunt Resistor
- Junction Temperature to  $+200^\circ\text{C}$

(1) Pulse Test: Pulse Width = 300 μs, Duty Cycle ≤ 2.0%.

**MJ11013 MJ11015 MJ11012 MJ11014 MJ11016**

**Figure 2. DC Current Gain (1)**

**Figure 3. Small-Signal Current Gain**

**Figure 4. "On" Voltages (1)**

**Figure 5. Active Region DC Safe Operating Area**

There are two limitations on the power handling ability of a transistor average junction temperature and secondary breakdown. Safe operating area curves indicate  $I_C - V_{CE}$  limits of the transistor that must be observed for reliable operations e.g., the transistor must not be subjected to greater

dissipation than the curves indicate.

At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by secondary breakdown.
